

KEY SERVICES:
TILT-UP

KEY SERVICES

> DESIGN-BUILD

LJB has long been committed to the design-build delivery method as a means to provide enhanced quality as well as schedule and budget savings to our clients.

> DEVELOPMENT SERVICES

LJB's experienced professionals protect the interests of owners and developers by helping them make the best decisions up front to benefit the long-term health of the project.

LJB's experience, expertise and continual innovation in tilt-up design has made us a leader in the growing tilt-up industry.

In site cast tilt-up construction, the floor slab is cast early in the process, and concrete wall panels are cast directly on the floor slab before being tilted into final position. With attributes of long-term value, flexibility, speed, durability and architectural freedom, the tilt-up method helps owners meet ever-increasing demands for new facilities.

Engineers in LJB's CON/STEEL division have been designing tilt-up buildings since the early 1970s—long before the benefits of tilt-up were globally realized. Today, standard details and economized design practices learned from decades of experience translate into efficient field production and higher quality construction for our clients.
